

ENANTIOMERICALLY PURE BASIC ARYLCYCLOALKYLHYDROXYCARBOXYLIC  
ESTERS, PROCESSES FOR THEIR PREPARATION AND THEIR USE IN  
MEDICAMENTS

Cross Reference to Related Application:

This is a division of U.S. application No. 09/901,217, filed  
July 9, 2001, which was a continuation-in-part of application  
10 No. 09/309,960, filed on May 11, 1999, now U.S. Patent No.  
6,307,060.

Background of the Invention:

Field of the Invention:

15 The present invention provides certain enantiomerically pure  
aminoalcohol esters of arylcycloalkylhydroxycarboxylic acids,  
and processes for their preparation and medicinal use.

Esters of arylcycloalkylhydroxy acids with cyclic alcohols  
20 containing a quaternary nitrogen represented by formula I

(I)

comprising a hydroxycarboxylic acid component in which AR is an aromatic ring and in which  $R_1$  is a cycloaliphatic ring, and comprising an alcohol component in which the hydroxyl group is located on a dimethylpyrrolidinium ring ( $n=1$ ) or

5 dimethylpiperidinium ring ( $n=2$ ) in which  $R_2 = R_3$  is a lower alkyl and in which A is a halide, have in some instances been described as spasmolytics. If the two radicals  $R_2$  and  $R_3$  are identical, compounds of formula I have two chiral centers.

One of the centers can be assigned to the acid moiety and

10 relates to the position labeled 2', the second chiral center is located in the cyclic ring system at the position labeled

3. Since compounds of this structure accordingly have two chiral centers, four stereoisomers ( $3R,2'R$ ;  $3S,2'R$ ;  $3R,2'S$  and  $3S,2'S$ ) are possible in principle. To date, pure

15 stereoisomers of the formula I compound have been neither isolated nor synthesized, nor have they been investigated pharmacologically - which is essential for the subject matter of the present patent application. The most important representative of the formula 1, which is also used in

20 therapy, is glycopyrronium bromide ( $AR = \text{phenyl}$ ,  $R_1 = \text{cyclopentyl}$ ,  $R_2 = R_3 = \text{methyl}$ ,  $n = 1$ ,  $A = \text{Br}$ ). The

international non-proprietary name glycopyrronium bromide refers to the racemic mixture of diastereomers, which, accordingly, contains all four stereoisomers.

The publications and patents that have hitherto been published deal either with the drug glycopyrronium bromide in the form of a mixture of stereoisomers (CAS 596-51-0), with erythro- (RN 59677-73-5) or threo- (RN 59677-70-2) configured racemates of the tertiary amino ester (CRN 131118-11-1), which can be considered as only representing an intermediate in the synthesis of the compounds of the formula 1, or with the mixture of stereoisomers of the analogous cyclohexyl derivative ( $R_1$  = cyclohexyl) of the formula I (where  $n = 1$ ) (RN 101564-29-8). The publications quoted in Chemical Abstracts 80:53209h and 80:53214f describe the results of the analyses of the crystal structures of the compounds glycopyrronium bromide and hexapyrronium bromide which are in the form of mixtures of stereoisomers. The publications quoted in Chemical Abstracts 80:66587e, 80:66588f and 89:191258 describe the results of pharmacological investigations with the mixture of stereoisomers of the compound glycopyrronium bromide, or of combination products of this substance with neostigmine and pyridostigmine. The publications quoted in Abstracts 84:43164h and 85:32832u describe the partial separation of the mixture of stereoisomers by means of a crystallization with 5-nitroisophthalic acid and the study of the threo- or erythro-configured racemates already mentioned above by NMR. Here, the authors succeeded, starting from the mixture of stereoisomers (CRN 131118-11-1), only in separating the diastereomers into the two racemates, but they did not succeed

in preparing the enantiomerically pure compounds. The publications quoted in Chemical Abstracts 96:219498m, 105:48928x, 113:158782t, 89:191258k and the European Patent EP 128886 A2 describe the results of studies on the

5 chromatographic analysis of the mixture of stereoisomers of the compound glycopyrronium bromide and the preparation of the stationary phases used. A separation of the enantiomers or an isolation of the individual stereoisomers of the formula I is not reported in any of the above-mentioned publications. In  
10 all cases mentioned, HPL-chromatographic separation succeeded only at the stage of the diastereomers. Thus, the preparation of the enantiomerically pure compounds of the formula according to the present invention is not known from the prior art.

15 The pharmacological action of medicinal substances of formula I is based on their interaction with muscarinic acetylcholine receptors (muscarine receptors). They are therefore referred to as m-cholinoceptor antagonists or parasympatholytics or -  
20 owing to their relaxing effect on smooth muscles - as neurotropic spasmolytics. The multifarious effects of the parasympatholytics include: acceleration of the heart rate, reduced secretion of tears, saliva, perspiration, and of the glands of the digestive tract, relaxation of the smooth  
25 muscles of the bronchi, the gastrointestinal tract, the bile ducts, the urethra and the urinary bladder, pupil dilation and

impairment of accommodation. Quaternary spasmolytics, which include the compounds of the formula I, do not cross the blood-brain barrier and therefore have no central activity. Depending on the mode of administration, the desired and  
5 undesired effects of parasympatholytics vary. If these substances are used as spasmolytics, the reduced secretion of saliva or pupil dilation, for example, will be referred to as side effect.

10 Based on recent research, it is known that the structure of muscarine receptors is not uniform, but that the pharmacological effects can be attributed to interactions with at least four different muscarine receptor subtypes. On the one hand, their distribution in different organs varies and,  
15 on the other hand, different muscarine receptor subtypes having different functions are involved in some neuronal signal transduction cascades. Various effects or side effects can be attributed to interactions with the different receptor subtypes, so that high subtype specificity is one of the aims  
20 in the development of modern spasmolytics.

Glycopyrronium bromide is an active compound which has been established for a long time but which does not meet the requirements of a "modern" therapeutic of this type. However,  
25 glycopyrronium bromide is not only a racemate but additionally a mixture of diastereomers in which, depending on the

preparation process, the ratios of the individual isomers in the product can in fact vary. Such isomeric active compound mixtures may therefore show random subtype profiles, making targeted use difficult and provoking the occurrence of undesirable side effects.

#### Summary of the Invention:

It is accordingly an object of the invention to provide enantiomerically pure esters, as well as processes for their preparation and their therapeutic use, that overcome the above-mentioned disadvantages of the prior art racemates of this type.

With the foregoing and other objects in view, the present invention provides enantiomerically pure esters enantiomerically enriched to an enantiomeric purity of 90% minimum enantiomeric excess (ee) selected from the group consisting of the (3R,2'R)-, (3S,2'R)-, (3R,2'S)- and (3S,2'S)-configured enantiomers of the formula I

in which

R<sub>1</sub> is a mono-, bi- or tricyclic, saturated or unsaturated C<sub>3</sub>-C<sub>9</sub>-cycloaliphatic radical which is unsubstituted or substituted

by one or more C<sub>1</sub>-C<sub>6</sub>-alkyl, C<sub>2</sub>-C<sub>6</sub>-alkenyl and/or C<sub>2</sub>-C<sub>6</sub>-alkynyl radical(s) and/or by one or more of the halogen atoms fluorine, chlorine, bromine or iodine;

R<sub>2</sub> is a C<sub>1</sub>-C<sub>6</sub>-alkyl, C<sub>2</sub>-C<sub>6</sub>-alkenyl or C<sub>2</sub>-C<sub>6</sub>-alkynyl radical which is unsubstituted or substituted by one or more of the halogen atoms fluorine, chlorine, bromine or iodine;

R<sub>3</sub> is a C<sub>1</sub>-C<sub>6</sub>-alkyl, C<sub>2</sub>-C<sub>6</sub>-alkenyl or C<sub>2</sub>-C<sub>6</sub>-alkynyl radical which is unsubstituted or substituted by one or more of the halogen atoms fluorine, chlorine, bromine or iodine;

AR is an aromatic radical having 6 to 10 carbon atoms which can be substituted by one or more lower alkyl group(s) having 1 to 6 carbon atoms, trifluoromethyl group(s), cyano group(s), alkoxy group(s), nitro group(s), amino group(s) and/or one or more halogen atom(s) - identical to or different from one another -

or

a 5- to 6-membered heteroaromatic ring containing oxygen, sulfur and/or nitrogen as heteroatoms and to which a further aromatic radical can be fused and which can be unsubstituted or substituted by one or more lower alkyl group(s) having 1 to 3 carbon atoms, trifluoromethyl group(s), cyano group(s), alkoxy group(s), nitro group(s), amino group(s) and/or one or

more halogen atom(s) - identical to or different from one another;

n is an integer 1, 2 or 3; and

5 A is an anion of a pharmacologically acceptable acid.

In accordance with an additional feature of the invention, there are provided processes for the preparation of these enantiomerically pure esters of formula I and their use as  
10 medicaments.

In accordance with a further feature of the invention, preference is given to compounds of the formula I in which

15 R<sub>1</sub> is a mono- or bicyclic C<sub>5</sub>-C<sub>7</sub>-cycloalkyl radical which is unsubstituted or substituted by one or more C<sub>1</sub>-C<sub>3</sub>-alkyl, C<sub>2</sub>-C<sub>6</sub>-alkenyl or

C<sub>2</sub>-C<sub>6</sub>-alkynyl radical(s) and/or by one or more halogen atom(s) such as fluorine, chlorine, bromine or iodine;

20 R<sub>1</sub> is a mono- or bicyclic C<sub>5</sub>-C<sub>7</sub>-cycloaliphatic radical which is unsubstituted or substituted by one or more C<sub>1</sub>-C<sub>3</sub>-alkyl, C<sub>2</sub>-C<sub>6</sub>-alkenyl or C<sub>2</sub>-C<sub>6</sub>-alkynyl radical(s) and/or by one or more of the halogen atoms fluorine, chlorine, bromine or iodine;

R<sub>2</sub> is a C<sub>1</sub>-C<sub>3</sub>-alkyl, C<sub>2</sub>-C<sub>4</sub>-alkenyl or C<sub>2</sub>-C<sub>4</sub>-alkynyl radical which is unsubstituted or substituted by one or more halogen atoms fluorine, chlorine, bromine or iodine;

R<sub>3</sub> is a C<sub>1</sub>-C<sub>3</sub>-alkyl, C<sub>2</sub>-C<sub>4</sub>-alkenyl or C<sub>2</sub>-C<sub>4</sub>-alkynyl radical which is unsubstituted or substituted by one or more halogen atoms fluorine, chlorine, bromine or iodine;

AR is a C<sub>6</sub>-C<sub>10</sub>-aromatic radical or a heteroaromatic radical containing sulfur as heteroatom;

n is an integer 1 or 2; and

A is an anion of a pharmacologically acceptable mineral acid or of a carboxylic acid.

Special preference according to this invention is given to those enantiomerically pure esters of formula I in which

R<sub>1</sub> is a cyclopentyl, a cyclohexyl or a norbornyl radical;

R<sub>2</sub> is a methyl radical;

R<sub>3</sub> is a methyl radical;

AR is a phenyl radical or thienyl radical;

n is an integer 1 or 2;

A is fluoride, chloride, bromide or iodide,  
and in which OH, AR and R<sub>1</sub> are arranged clockwise when viewed  
looking toward the carboxyl group.

5 In accordance with this invention, "enantiomerically pure" is  
defined in terms of "enantiomeric excess" (e.e.) which is  
calculated from the ratio of the difference between the  
amounts of the respective enantiomers present and the sum of  
these amounts  $(R - S)/(R + S)$  and expressed as a percentage.  
10 To illustrate, a preparation containing 95% of one enantiomer  
and 5% of the opposite enantiomer has an enantiomeric excess  
(e.e.) of  $(95-5)/(95+5) = 90\%$ . The enantiomerically pure  
esters of formula I according to this invention have an e.e.  
of at least 90%, preferably at least 96%. Enantiomerically  
15 pure esters of formula I according to this invention with an  
e.e. of at least 96% are especially preferred, and even  
greater preference among these is given to enantiomerically  
pure esters of formula I according to this invention with an  
e.e. of at least 97% and particularly with an e.e. of at least  
20 98%.

#### Description of the Preferred Embodiments:

Unless defined otherwise, in formula I C<sub>1</sub>-C<sub>6</sub>-alkyl is a  
branched or unbranched alkyl radical having 1 to 6 carbon  
25 atoms which can be unsubstituted or substituted by one or more  
halogen atoms. For the purpose of the present invention, C<sub>1</sub>-

C<sub>6</sub>-alkyl radicals are, for example, methyl, ethyl, propyl, 1-methylethyl (isopropyl), butyl, 1-methylpropyl, 2-methylpropyl, 1,1-dimethylethyl, n-pentyl, 1-methylbutyl, 2-methylbutyl, 3-methylbutyl, 1,1-dimethylpropyl, 1,2-dimethylpropyl, 2,2-dimethyl propyl, 1-ethylpropyl, hexyl, 1-methylpentyl, 2-methylpentyl, 3-methylpentyl, 4-methylpentyl, 1,1-dimethylbutyl, 1,2-dimethylbutyl, 1,3-dimethylbutyl, 2,2-dimethylbutyl, 2,3-dimethylbutyl, 3,3-dimethylbutyl, 1-ethylbutyl, 2-ethylbutyl, 1,1,2-trimethylpropyl, 1,2,2-trimethylpropyl, 1-ethyl-1-methylpropyl and 1-ethyl-2-methylpropyl.

Unless indicated otherwise, alkyl substituents containing 1 to 3 carbon atoms are preferably methyl, ethyl, n-propyl or isopropyl.

Unless defined otherwise, C<sub>2</sub>-C<sub>6</sub>-alkenyl is a branched or unbranched alkenyl radical having 2 to 6 carbon atoms which contains one or optionally two double bonds, and which may be unsubstituted or substituted by one or more halogen atoms.

For the purpose of the present invention, C<sub>2</sub>-C<sub>6</sub>-alkenyl radicals are, for example vinyl, 2-propenyl (allyl), 2-butenyl, 3-butenyl, 1-methyl-2-propenyl, 2-methyl-2-propenyl, 2-pentenyl, 3-pentenyl, 4-pentenyl, 1-methyl-2-butenyl, 2-methyl-2-butenyl, 3-methyl-2-butenyl, 1-methyl-3-butenyl, 2-methyl-3-butenyl, 3-methyl-3-butenyl, 1,1-dimethyl-2-propenyl,

1,2-dimethyl-2-propenyl, 1-ethyl-2-propenyl, 2-hexenyl, 3-hexenyl, 4-hexenyl, 5-hexenyl, 1-methyl-2-pentenyl, 2-methyl-2-pentenyl, 3-methyl-2-pentenyl, 4-methyl-2-pentenyl, 1-methyl-3-pentenyl, 2-methyl-3-pentenyl, 3-methyl-3-pentenyl, 4-methyl-3-pentenyl, 1-methyl-4-pentenyl, 3-methyl-4-pentenyl, 4-methyl-4-pentenyl, 1,1-dimethyl-2-butenyl, 1,1-dimethyl-3-butenyl, 1,2-dimethyl-2-butenyl, 1,2-dimethyl-3-butenyl, 1,3-dimethyl-2-butenyl, 1,3-dimethyl-3-butenyl, 2,2-dimethyl-3-butenyl, 2,3-dimethyl-2-butenyl, 2,3-dimethyl-3-butenyl, 1-ethyl-2-butenyl, 1-ethyl-3-butenyl, 2-ethyl-1-butenyl, 2-ethyl-2-butenyl, 2-ethyl-3-butenyl, 1,1,2-trimethyl-2-propenyl, 1-ethyl-1-methyl-2-propenyl and 1-ethyl-2-methyl-2-propenyl, among which the allyl radical is preferred.

Unless defined otherwise, C<sub>2</sub>-C<sub>6</sub>-alkynyl is a branched or unbranched alkynyl radical having 2 to 6 carbon atoms which may contain one or optionally two triple bonds or one triple bond and one double bond and which may be unsubstituted or substituted by one or more halogen atoms. For the purpose of the present invention, C<sub>2</sub>-C<sub>6</sub>-alkynyl radicals are, for example 2-propynyl (propargyl), 2-butyne, 3-butyne, 1-methyl-2-propynyl, 2-pentyne, 3-pentyne, 4-pentyne, 1-methyl-2-butyne, 1-methyl-3-butyne, 2-methyl-3-butyne, 1,1-dimethyl-2-propynyl, 1-ethyl-2-propynyl, 2-hexynyl, 3-hexynyl, 4-hexynyl, 5-hexynyl, 1-methyl-2-pentyne, 4-methyl-2-pentyne, 1-methyl-3-pentyne, 2-methyl-3-pentyne, 1-methyl-4-pentyne,

3-methyl-4-pentynyl, 1,1-dimethyl-2-butyryl, 1,1-dimethyl-3-butyryl, 1,2-dimethyl-3-butyryl, 2,2-dimethyl-3-butyryl, 1-ethyl-2-butyryl, 1-ethyl-3-butyryl, 2-ethyl-3-butyryl or 1-ethyl-1-methyl-2-propynyl, among which the propargyl radical  
5 is preferred.

In general, cycloaliphatic radical is a saturated or unsaturated cyclic hydrocarbon radical having 3 to 9 carbon atoms which can be unsubstituted or substituted by a halogen  
10 atom or a plurality of halogen atoms - preferably fluorine - which can be identical to or different from one another.

Preference is given to cyclic hydrocarbons having 5 or 6 carbon atoms. Examples which may be mentioned are cyclopropyl, cyclobutyl, cyclopentyl, cyclopentenyl,  
15 cyclohexyl, cyclohexenyl, cycloheptyl, cycloheptenyl, cycloheptadienyl, cyclooctyl, cyclooctenyl, cyclooctadienyl and cyclononyl.

In general, aryl is an aromatic radical having 6 to 10 carbon  
20 atoms which can be unsubstituted or substituted by one or more lower alkyl group(s) having 1 to 3 carbon atoms, trifluoromethyl group(s), cyano group(s), alkoxy group(s), nitro group(s), amino group(s) and/or one or more halogen atom(s) - identical to or different from one another; the  
25 preferred aryl radical is an unsubstituted or substituted

phenyl radical, preferred substituents being halogen - such as fluorine, chlorine or bromine - cyano and hydroxyl.

In the context of the definition given above, heteroaryl is  
5 generally a 5- to 6-membered ring which can contain oxygen, sulfur and/or nitrogen as heteroatoms and onto which another aromatic ring may be fused. Preference is given to 5- and 6-membered aromatic rings which contain an oxygen, a sulfur and/or up to two nitrogen atoms and which are optionally  
10 benzo-fused.

Particular heterocyclic systems which may be mentioned are, for example, acridinyl, acridonyl, alkylpyridinyl, anthraquinonyl, azazulenyl, azabenzanthracenyl, azabenzanthrenyl, azachrysenyl, azacyclazinyl, azaindolyl, 15 azanaphthacenyl, azanaphthalenyl, azatriphenylenyl, azepinyl, azinoindolyl, azinopyrrolyl, benzacridinyl, benzazepinyl, benzofuryl, benzonaphthyridinyl, benzopyranonyl, benzopyranyl, benzopyronyl, benzoquinolinyl, benzoquinoliziny, 20 benzothiepinyl, benzothienyl, benzylisoquinolinyl, bipyridinyl, carbazolyl, carbolinyl, catechinyl, chromenopyronyl, chromonopyranyl, coumarinyl, coumaronyl, diazaanthracenyl, diazaphenanthrenyl, dibenzazepinyl, dibenzofuranyl, dibenzothienyl, dichromylenyl, dihydrofuran, 25 dihydroisocoumarinyl, dihydroisoquinolinyl, dihydropyranyl, dihydropyridinyl, dihydropyridonyl,

dihydropyronyl, dihydrothiopyranyl, dioxanthynyl, flavanyl,  
flavonyl, fluoranyl, fluoresceinyl, furanochromanyl,  
furanonyl, furanoquinoliny, furanyl, furopyranyl,  
furopyronyl, heteroazulenyl, hexahydropyrazinoisoquinoliny,  
5 hydrofuranyl, hydrofuranonyl, hydroindolyl, hydropyranyl,  
hydropyridinyl, hydropyrrolyl,  
hydroquinoliny, hydrothiocromenyl, hydrothienyl,  
indolizidinyl, indoliziny, indolonyl, isatinyl, isatogenyl,  
isobenzofurandionyl, isobenzofuranyl, isochromanyl,  
10 isoflavonyl, isoindoliny, isoindolobenzazepinyl, isoindolyl,  
isoquinoliny, isoquinuclidinyl, monoazabenzonaphthenyl,  
naphthimidazopyridinedionyl, naphthindolizinedionyl,  
naphthodihydropyranyl, naphthofuranyl, naphthyridinyl,  
oxepinyl, oxindolyl, oxolenyl, perhydroindolyl,  
15 phenanthraquinonyl, phthalideisoquinoliny, phthalimidyl,  
phthalonyl, pyrazinyl, pyranoazinyl, pyranoazolyl,  
pyranopyrandionyl, pyranopyridinyl, pyranoquinoliny,  
pyranopyrazinyl, pyranyl, pyrazolopyridinyl,  
pyridinethionyl, pyridinonaphthalenyl, pyridinopyridinyl,  
20 pyridinyl, pyridocolinyl, pyridoindolyl, pyridopyridinyl,  
pyridopyrimidinyl, pyridopyrrolyl, pyridoquinoliny, pyronyl,  
pyrrocolinyl, pyrrolizidinyl, pyrroliziny, pyrrolodioazinyl,  
pyrrolonyl, pyrrolopyrimidinyl, pyrroloquinolonyl, pyrrolyl,  
quinacridonyl, quinoliny, quinolizidinyl, quinoliziny,  
25 quinolonyl, quinuclidinyl, rhodaminyl, spirocoumaranyl,  
succinimidyl, sulfolanyl, sulfolenyl, tetrahydrofuranyl,

tetrahydroisoquinolinyl, tetrahydropyranyl,  
tetrahydropyridinyl, tetrahydrothiapyranyl, tetrahydrothienyl,  
tetrahydrothiopyranonyl, tetrahydrothiopyranyl, tetronyl,  
thiaphenyl, thiachromanyl, thianaphthenyl, thiapyranyl,  
5 thiapyronyl, thiazolopyridinyl, thienopyridinyl,  
thienopyrrolyl, thienothienyl, thiopinyl, thiochromenyl,  
thiocoumarinyl, thiopyranyl, triazaanthracenyl,  
triazinoindolyl, triazolopyridinyl, tropanyl, xanthenyl,  
xanthonyl, xanthidolyl, alloxazinyl, anthranilyl,  
10 azabenzanthrenyl, azabenzonaphthenyl, azanaphthacenyl,  
azaphenoxazinyl, azapurinyl, azinyl, azoloazinyl, azolyl,  
benzazinyl, benzimidazolethionyl, benzimidazolonyl,  
benzisoethiazolyl, benzisoxazolyl, benzocinnolinyl,  
benzodiazocinyl, benzodioxolanyl; benzodioxolyl,  
15 benzopyridazinyl, benzothiazepinyl, benzothiazinyl,  
benzothiazolyl, benzoxazinyl, bezoxazolinonyl, benzoxazolyl,  
cinnolinyl, depsidinyl, diazaphenanthrenyl, diazepinyl,  
diazinyl, dibenzoxazepinyl, dihydrobenzimidazolyl,  
dihydrobenzothiazinyl, dihydrooxazolyl, dihydropyridazinyl,  
20 dihydropyrimidinyl, dihydrothiazinyl, dioxenyl, dioxepinyl,  
dioxinonyl, dipyrimidopyrazinyl, dithiolenyl, dithiolyl,  
flavinyl, furopyrimidinyl, hexahydropyrazinoisoquinolinyl,  
hydroimidazolyl, hydropyrazinyl, hydropyrazolyl,  
hydropyridazinyl, hydropyrimidinyl, imidazolinyl, imidazolyl,  
25 imidazoquinazolinyl, imidazothiazolyl, indazolebenzopyrazolyl,  
indoxazenyl, inosinyl, isoalloxazinyl, isothiazolyl,

isoxazolidinyl, isoxazolinonyl, isoxazolinyl, isoxazolonyl,  
isoxazolyl, lumaziny, naphthimidazolyl, oroticyl,  
oxazinonyl, oxazolinonyl, oxazolinyl, oxazolonyl,  
oxazolopyrimidinyl, oxazolyl, perimidinyl, phenazinyl,  
5 phenothiazinyl, phenoxathiinyl, phenoxazinyl, phenoxazonyl,  
phthalazinyl, polyquinoxaliny, pteridinyl, pterinyl, purinyl,  
pyrazinyl, pyrazolidinyl, pyrazolidonyl, pyrazolinonyl,  
pyrazolyl, pyridazinyl, pyridazonyl, pyridopyrazinyl,  
pyridopyrimidinyl, pyrimidinethionyl, pyrimidinyl,  
10 pyrimidionyl, pyrimidoazepinyl, pyrimidopteridinyl,  
pyrrolobenodiazepinyl, pyrrolodiazinyl, pyrrolopyrimidinyl,  
quinazolidinyl, quinazolinonyl, quinazolinyl, quinoxaliny,  
tetrahydroquinoxaliny, thiazepinyl, thiazinyl,  
thiazolidinonyl, thiazolidinyl, thiazolinonyl, thiazolinyl,  
15 thiazolobenzimidazolyl, thiazolyl, thienopyrimidinyl,  
thiazolidinonyl, triazolopyrimidinyl, xanthinyl,  
azabenzonaphthenyl, benzofuroxanyl, benzothiadiazinyl,  
benzotriazepinonyl, benzotriazolyl, benzoxadiazinyl,  
dioxadiazinyl, dithiadazolyl, dithiazolyl, furazanyl,  
20 furoxanyl, hydrotriazolyl, hydroxytrizinyl, oxadiazinyl,  
oxadiazolyl, oxathiazinonyl, oxatriazolyl, pentazinyl,  
pentazolyl, petrazinyl, polyoxadiazolyl, sydonyl, tetraoxanyl,  
tetrazepinyl, tetrazinyl, tetrazolyl, thiadiazinyl,  
thiadiazolinyl, thiadiazolyl, thiadioxazinyl, thiatriazinyl,  
25 thiatriazolyl, triazepinyl, triazinoindolyl,

triazinyl, triazolinedionyl, triazolinyl, triazolyl,  
triphenodioxazinyl, triphenodithiazinyl, or trithiadiazepinyl.

A pharmaceutically suitable salt is referred to as the salt of  
5 a pharmacologically acceptable acid, preferably a halogen  
acid.

The invention also provides a process for preparing compounds  
of formula I according to the invention in which a preferably  
10 tertiary aminoalcohol component in enantiomerically pure form  
and an arylcycloalkylhydroxycarboxylic acid in  
enantiomerically pure or preferably racemic form are reacted  
to give the ester which is finally quaternized using a  
suitable alkylating agent, preferably an alkyl halide. In the  
15 preferred process variant, after conversion of the racemic  
acid into the ester, the resulting diastereomers are separated  
by crystallization. The invention also provides the use of  
the enantiomerically pure esters of the formula I in  
medicaments.

20

The essential steps of the preparation process entail, in  
particular, that an enantiomerically pure  $\alpha$ -hydroxycarboxylic  
acid (R or S enantiomer) of the formula II

in which  $R_1$  and AR are each as previously defined, or a lower alkyl ester or an activated acid derivative thereof, is reacted with the R or S enantiomer of an enantiomerically pure amino alcohol of the formula III

in which  $R_2$  and  $n$  are each as previously defined, and the resulting enantiomerically pure ester of the formula IV

is reacted with an alkylating agent of the formula V

$R_3 - X$  (V)

in which  $R_3$  is as previously defined and X is a leaving group which can be replaced by a tertiary amino group, and the resulting salt is isolated or, if not a salt of pharmaceutically acceptable anion A, converted to such salt by anion exchange.

In an alternative process for preparing an enantiomerically pure ester of formula I, the racemic form of an  $\alpha$ -a-hydroxycarboxylic acid of the formula II

in which  $R_1$  and AR are each as previously defined, or a lower alkyl ester or an activated acid derivative thereof, is

reacted with the R or S enantiomer of an enantiomerically pure amino alcohol of the formula III

in which  $R_2$  and  $n$  are each as previously defined, the resulting mixture of diastereomeric esters of the formula IV

5

is separated, the desired diastereomer is reacted with an alkylating agent of the formula V

10 in which  $R_3$  is as previously defined, and X is a leaving group which can be replaced by a tertiary amino group, and the resulting salt is isolated or, if not a salt of pharmaceutically acceptable anion A, converted to such salt by anion exchange.

15

When the racemate of a medicinal substance is separated into the enantiomers, it is frequently found that only one of the enantiomers is pharmacologically active. It can be seen from Example 9, especially from the logarithmically plotted graph  
20 in Fig. 1, that for compounds of the present patent application in principle all isomers can have affinity for the receptor. However, on the one hand, the individual enantiomers show distinctly different affinities and, on the

other hand, there are also distinct variations in the  $M_1$ - $M_4$  subtype specificity, whereby the affinities differ by a factor of as much as approximately 1000. In particular, the high affinity for the  $M_3$  receptor subtype, coupled with a relatively low affinity for the  $M_2$  receptor subtype makes the preferred higher-affinity enantiomers (for example in Example 9: 1 b and 1 c), particularly suitable active compounds for the therapy of spasms of the smooth muscles of the gastrointestinal tract and the urogenital tract and for the treatment of obstructive respiratory diseases. Owing to the fact that they can be administered at a particularly low dosage, because of their high affinity, and the fact that they have a particularly favorable subtype profile they afford therapeutic results more efficiently, and have a considerably reduced potential for side effects.

Another particularly important factor for the therapeutic use of enantiomers of the formula I consists in the kinetic subtype selectivity. As can be seen in Example 10 and Fig. 2, the dissociation half-times of the individual enantiomers 1a-1d of the compound of the formula I ( $AR = \text{phenyl}$ ,  $R_1 = \text{cyclopentyl}$ ,  $R_2 = R_3 = \text{methyl}$ ,  $n = 1$ ,  $A = 1$ ), for the  $M_3$  receptor subtype are between 1 minute and 120 minutes, whereas the dissociation half-times on the  $M_1$ ,  $M_2$  and  $M_4$  subtypes are in the range of a few minutes. In particular, compounds which have a particularly long dissociation half-time permit, owing

to their strong affinity, a particularly low dosage, coupled with a long-lasting therapeutic effect. The possibility of influencing the duration of the pharmacological effect in a targeted manner by targeted selection of an enantiomer having  
5 a particular dissociation half-time represents a further important advance of the compounds of the present invention over the prior art. The properties described were unforeseeable, and there were also no references in the literature.

10

To summarize, it can be stated that enantiomerically pure esters of formula I are distinguished from the prior art by their pharmacodynamic selectivity. In the preferred configuration, they have considerably higher affinity for  
15 muscarinic  $M_3$  receptors than for  $M_2$  receptors, and in addition they show kinetic selectivity for  $M_3$  receptors, i.e. they diffuse only very slowly from this receptor type. Owing to these distinctive properties, they are quite particularly suitable for the therapy of spasms of smooth muscles of the  
20 gastrointestinal tract and the urogenital tract, and for the treatment of obstructive respiratory diseases, such as bronchial asthma and chronic bronchitis. Compared with the nonselective parasympatholytics which have previously been used, they differ considerably in their pharmacological  
25 properties, owing to their defined subtype selectivity. Compared with known mixtures of stereoisomers or racemates,

the compounds can additionally be employed at a particularly low dosage, thus minimizing side effects.

Accordingly, the invention prefers the use of enantiomerically pure esters (3R,2'R, 3S,2'R, 3R,2'S or -3S,2'S enantiomers) of the formula I in medicaments for the therapy of spasms of the smooth muscles of the gastrointestinal tract and the urogenital tract and for the treatment of obstructive respiratory diseases (bronchial asthma, chronic bronchitis).

Such medicaments comprise a pharmaceutically acceptable carrier and an effective amount of enantiomerically pure ester of formula I. Any convenient carrier can be used, but preference is given to dosage forms for oral or injectable administration.

Special preference is given to using enantiomers of the formula I having high M<sub>3</sub> subtype selectivity (pK<sub>i</sub> greater than 10) and long dissociation half-times on the M<sub>3</sub> receptor in medicaments for the treatment of obstructive respiratory

diseases, preferably bronchial asthma and chronic bronchitis.

Particularly preferred dosage forms for such medicaments include an inhalable dry powder formulation and an aerosol for inhalation by the person in need of treatment. Such dry powder formulation can be formulated, for example, with an inert solid diluent such as lactose. Particularly suitable grades of lactose for inhalation having controlled particle

properties are commercially available. Such aerosol can be formulated, for example, with a propellant such as dichlorodifluoromethane, trichlorofluoromethane, 2H-heptafluoropropane, octafluorocyclobutane and combinations thereof, and can include minor amounts of acceptable surfactant such as lecithin to facilitate absorption in bronchial tissues.

The invention described above is now illustrated by the examples below. To the person skilled in the art, various other embodiments will become evident from the description provided. However, express reference is made to the fact that the examples and the description are intended only for illustration and do not constitute a limitation of the invention.

#### Examples:

##### Example 1:

Preparation of (3S,2'S)-3-

[(cyclopentylhydroxyphenylacetyl)oxy]-1,1-

dimethylpyrrolidinium iodide 1a (formula I, AR = phenyl, R<sub>1</sub> = cyclopentyl, R<sub>2</sub> = R<sub>3</sub> = methyl, n = 1, A = 1).

A dry reaction apparatus is charged with 20 mmol of (3S)-1-methyl-3-pyrrolidinol and 24 mmol of methyl 2-cyclopentyl-2-

hydroxyphenylacetate in 500 ml of n-heptane absolute. 200 ml of heptane are then distilled over and discharged via a water separator to remove all traces of moisture. After cooling, 2 mmol of NaH or NaOMe (10 mol%) are added, and the mixture is once more heated to the boil. The temperature is chosen such that the n-heptane distills over only slowly. Over a period of 5-6 h, the amount distilled off is continuously replaced from the dropping funnel until the hydroxy ester has been completely converted. The reaction mixture is subjected to aqueous work-up and extracted with ether, and the crude product is then dried over  $\text{Na}_2\text{SO}_4/\text{K}_2\text{CO}_3$  2:1. The drying agent is filtered off with suction and the filtrate is then precooled in an ice bath and, with ice-cooling, admixed with ethereal HCl/2-butanone until saturated. The product is initially obtained as an oil. Addition of 2-butanone or distillative removal of ether gives a clear solution which is cooled with ice, causing the hydrochloride of the mixture of diastereomers (3S,2'R/S)-3-  
[(cyclopentylhydroxyphenylacetyl)oxy]-1-methylpyrrolidine (formula IV, AR = phenyl,  $\text{R}_1$  = cyclopentyl,  $\text{R}_2$  = methyl,  $n = 1$ ) to crystallize. Yield 15.7 mmol. M. p. 176°C.

Preparation of the hydrogen tartrates: separation of diastereomers by fractional crystallization:

To prepare the hydrogen tartrates, 15 mmol of the hydrochloride described above and  $\text{NaHCO}_3/\text{K}_2\text{CO}_3$  buffer, pH 10,

are transferred into a separatory funnel, and the aqueous phase is extracted three times with 150 ml of diethyl ether each time. The combined ethereal phases are admixed with 100 ml of ethyl acetate and dried over  $\text{Na}_2\text{SO}_4/\text{K}_2\text{CO}_3$  2: 1. The drying agent is filtered off with suction and the filtrate is reduced to a volume of approximately 100 ml using a rotary evaporator. The solution is heated to approximately  $60^\circ\text{C}$  and admixed with a solution of 1.2 eq (18 mmol) of enantiomerically pure tartaric acid in ethyl acetate. The hydrogen tartrate crystallizes overnight in a refrigerator. By repeated recrystallization, the diastereomers can be separated up to a de of 99%.

Yield 8.3 mmol of (3S,2'S)-3-[(cyclopentylhydroxy-phenylacetyl)oxy]-1-methylpyrrolidine, D-(-)-hydrogen tartrate formula IV (AR = phenyl,  $\text{R}_1$  = cyclopentyl,  $\text{R}_2$  = methyl,  $n = 1$ ); m. p.  $178-179^\circ\text{C}$   $^1\text{H}$  NMR spectrum (300 MHz  $\text{CD}_4\text{O}$ ):  $\delta$  (ppm) 1.3-1.7 (M, 8H, cyclopentyl- $\text{CH}_2$ ), 2.05-2.1 (M, 1H, C4), 2.39-2.46 (M, 1H, C4), 2.77 (S, 3H, N-methyl), 2.97-3.0 (M, 1H, cyclopentyl C1), 3.18-3.25 (dd, 1H, C2,  $^2\text{J} = 12.8$  Hz,  $^3\text{J} = 0-1$  Hz), 3.31-3.5 (M, 2H, C5), 3.6-3.7 (dd, 1H,  $^3\text{J} = 5.2$  Hz,  $^2\text{J} = 13$  Hz, C2), 4.42 (S, 2H, tartrate), 5.34-5.39 (M, 1H, C3), 7.2-7.8 (M, 5H), assignments based on H,H COSY NMR

25 Quaternization:

After liberating the bases by extraction with ether from bicarbonate buffer pH 10 and drying over  $\text{Na}_2\text{SO}_4/\text{K}_2\text{CO}_3$  2:1, quaternization is carried out by addition of 3eq (20 mmol) of methyl iodide, and the resulting crystalline product (3S,2'S)-  
 5 3-[(cyclopentylhydroxyphenylacetyl)oxy]-1,1-dimethylpyrrolidinium iodide 1a (formula I, AR = phenyl,  $R_1$  = cyclopentyl,  $R_2 = R_3$  = methyl,  $n = 1$ ,  $A = 1$ ) is filtered off with suction. (The diastereomeric excesses can be determined by HPLC methods on  $\beta$ -cyclodextrin and "Whelck" phases, or by  
 10 evaluating NMR spectra of the hydrogen tartrates described above.)

(3S,2'S)-3-[(cyclopentylhydroxyphenylacetyl)oxy]-1,1-dimethylpyrrolidinium iodide (1a) formula I (AR = phenyl,  $R_1$  =  
 15 cyclopentyl,  $R_2 = R_3$  = methyl,  $n = 1$ ,  $A = 1$ ); m.p.  $165^\circ\text{C}$   $^1\text{H}$  NMR spectrum (300 MHz  $\text{CD}_4\text{O}$ ):  $\delta$  (ppm) (1.15-1.4 (M, 2H), 1.5-1.7 (M, 6H), cyclopentylmethylene), 2.2 (M, 1H, C4), 2.63 (M, 1H, C4), 2.9 (S, 3H, N-methyl), 2.93-2.99 (M, 1H, cyclopentyl methine), 3.1 (S, 3H, N-methyl), 3.43-3.47 (dd, 1H, C2,  $^2J=14\text{Hz}$ ,  $^3J=\text{OH}$ ), 3.5-  
 20 3.7 (M, 2H, C5), 3.75 (dd, 1 H, C2,  $^2J=13.7\text{Hz}$ ,  $^3J=6.05\text{Hz}$ ), 5.38 (M, 1H, C3), 7.15-7.4 (M, 3H), 7.5-7.65 (M, 2H)  $^{13}\text{C}$ -NMR 52 MHz  $\text{CD}_4\text{O}$   $\delta$  (ppm) (24.4-25.4) (4t, cyclopentyl methylene), 28.5

(t, C4), 47.4 (t, cyclopentyl methine), 51.3 (q, N-methyl), 51.8  
 25 (q, N-methyl), 63.6 (t, C5), 68.9 (t, C2), 72.0 (d, C3), 78.4

(s, hydroxy ester C2), 124.5(d), 126.1 (d), 126.7 (d), 140.5 (s), 172.4 (s).

The diastereomeric purity (de) was determined by comparing the integrals of the N-methyl protons of the diastereomeric hydrogentartrates in  $^1\text{H}$  NMR spectra (300 MHz,  $\text{CD}_4\text{O}$ ), or by HPLC analysis on  $\beta$ -cyclodextrin phases. (Cyclobond  $\beta$ -CD-OH, 50\*0.4 cm, buffer: 85%  $\text{H}_2\text{O}$ , 15%  $\text{CH}_3\text{CN}$ , 0.2%  $\text{CH}_3\text{COOH}$  V/V, 0.35 ml/min isocratic, UV detection: 236 nm).

10

#### Example 2:

Preparation of (3S,2'R)-3-

[(cyclopentylhydroxyphenylacetyl)oxy]-1,1 -

dimethylpyrrolidinium iodide 1b (formula I, AR = phenyl,  $\text{R}_1 =$

15 cyclopentyl,  $\text{R}_2 = \text{R}_3 = \text{methyl}$ ,  $n = 1$ ,  $A = 1$ )

From the mother liquors of the separation of diastereomers described in Example 1, the D-(-)-hydrogen tartrate of the (3S,2'R)-configured compound is crystallized by addition of ether. Repeated recrystallization results in a de of > 98 %.

20

(3S,2'R)-3-[(cyclopentylhydroxyphenylacetyl)oxy]-1-

methylpyrrolidine, D-(-)-hydrogen tartrate (formula IV, AR = phenyl,  $\text{R}_1 = \text{cyclopentyl}$ ,  $\text{R}_2 = \text{methyl}$ ,  $n = 1$ ): m.p. 158-160°C,

25

$^1\text{H}$  NMR (300 MHz  $\text{CD}_4\text{O}$ ):  $\delta$  (ppm) 1.3-1.7 (M, 8H, cyclopentyl  $\text{CH}_2$ ), 2.0-2.1 (M, 1H, C4), 2.39-2.46 (M, 1H, C4), 2.81 S, 3H, N-methyl),

2.93-3.05 (M, 1H, cyclopentyl) C1), 3.24-3.4 (M, 3H, C2, C5), 3.63-3.7 (dd, 1H,  $^3J=5, 2\text{Hz}$ ,  $^2J=13\text{Hz}$ , C2), 4.42 (S, 2H, tartrate), 5.38 (M, 1H, C3), 7.2-7.7 (M, 5H) Assignments based on H,H COSY NMR.

5 Quaternization was carried out as described above, giving the crystalline product

(3S, 2'R)-3-[(cyclopentylhydroxyphenylacetyl)oxy]-1,1-dimethylpyrrolidinium iodide 1b (formula I, AR = phenyl, R<sub>1</sub> = cyclopentyl, R<sub>2</sub> = R<sub>3</sub> methyl, n = 1, A = 1). M.p. 108-109°C  $^1\text{H}$

10 NMR (300 MHz CD<sub>4</sub>O):  $\delta$  (ppm) (1.15-1.4 (M, 2H), 1.5-1.7 (M, 6H), cyclopentyl methylene), 2.2 (M, 1H, C4), 2.65-2.85 (M, 1H, C4), 3.01 (M, 1H, cyclopentyl methine), 3.06 (S, 3H, N-methyl), 3.1 (S, 3H, N-methyl), 3.55-3.8 (M, 3H, C2, C5), 4.07 (dd, 1H, C2,  $^2J=13.8\text{Hz}$ ,  $^3J=6.2\text{Hz}$ ), 5.48 (M, 1H, C3), 7.26-7.4 (M, 3H),  
 15 7.5-7.65 (M, 2H).  $^{13}\text{C}$  NMR (50 MHz CD<sub>4</sub>O)/DEPT and CH correlation):  $\delta$  (ppm) (27.0 (t), 27.4 (t), 27.41 (t), 28.06 (t), cyclopentyl methylene), 31.26 (t, C4), 46.6 (t, cyclopentyl methine), 53.8 (q, N-methyl), 54.3 (q, N-methyl), 66.2 (t, C5), 71.5 (t, C2), 74.5 (d, C3), 81.2 (s, hydroxy ester C2), 127 (d),  
 20 128.8 (d), 129.35 (d), 143.2 (s), 175.0 (s).

The diastereomeric purity was determined as described in

Example 1.

Example 3:

Preparation of (3R,2'R)-3-

[(cyclopentylhydroxyphenylacetyl)oxy]-1,1-

dimethylpyrrolidinium iodide 1c (formula I, AR = phenyl, R<sub>1</sub> =  
5 cyclopentyl, R<sub>2</sub> = R<sub>3</sub> = methyl, n = 1, A = 1)

The preparation was carried out as described in Example 1,  
starting from (3R)-1-methyl-3-pyrrolidinol and using

L(+)-tartaric acid for separating the diastereomers. The

10 process described in Example 1 gives (3R,2'R)-3-

[(cyclopentylhydroxyphenylacetyl)oxy]-1,1-

dimethylpyrrolidinium iodide 1c (formula I, AR = phenyl, R<sub>1</sub> =  
cyclopentyl, R<sub>2</sub> = R<sub>3</sub> = methyl, n = 1, A = 1). The [<sup>1</sup>H] and

[<sup>13</sup>C] NMR analytical data correspond to those of the (3S,2'S)-

15 configured compound 1a given in Example 1. M.p. 165-166°C.

The diastereomeric purity was determined as described in  
Example 1.

20

Example 4:

Preparation of (3R,2'S)-3-

[(cyclopentylhydroxyphenylacetyl)oxy]-1,1-

dimethylpyrrolidinium iodide 1d (formula I, AR = phenyl, R<sub>1</sub> =

25 cyclopentyl, R<sub>2</sub> = R<sub>3</sub> = methyl, N = 1, A = 1)

From the mother liquors of the separation of the diastereomers of the 3R-configured compounds described in Example 1, the L-(+)-hydrogen tartrate of the (3R,2'S)-configured compound is crystallized by addition of ether. Repeated recrystallization gives a yield of > 98%.

Quaternization is likewise carried out as described in Example 1, giving the crystalline product (3R,2'S)-3-[(cyclopentylhydroxyphenylacetyl)oxy]-1,1-dimethylpyrrolidinium iodide 1d (formula I, AR = phenyl, R<sub>1</sub> = cyclopentyl, R<sub>2</sub> = R<sub>3</sub> = methyl, n = 1, A = 1). The [<sup>1</sup>H] and [<sup>13</sup>C] NMR analytical data correspond to those of the (3S,2'R)-configured compound 1b given in Example 2. M.p. 107-108°C.

The diasteromeric purity was determined as described in Example 1.

Formulae of the enantiomers 1a-1d of Examples 1-4

Example 5:

Preparation of (3S,2'S)-3-

[(cyclohexylhydroxyphenylacetyl)oxy]-1,1-dimethylpyrrolidinium  
bromide 2a (formula I, AR = phenyl, R<sub>1</sub> = cyclohexyl, R<sub>2</sub> = R<sub>3</sub> =  
5 methyl, n = 1, A = Br)

The compound of this Example 5 is prepared starting from (3S)-  
1-methyl-3-pyrrolidinol, methyl 2-cyclohexyl-2-  
hydroxyphenylacetate and NaOMe by the process described under  
10 Example 1. Transesterification and separation of the  
diastereomers of the 3S-configured L-(+)-hydrogen tartrates  
are carried out in a similar manner.

(3S,2'S)-3-[(cyclohexylhydroxyphenylacetyl)oxy]-1-

15 methylpyrrolidine, L-(+)-hydrogen tartrate: formula IV, (AR =  
phenyl, R<sub>1</sub> = cyclopentyl, R<sub>2</sub> = methyl, n = 1): <sup>1</sup>H-NMR (300 MHz  
CD<sub>4</sub>O): δ (ppm) 1.12-1.2 (M, 4H, cyclohexyl-CH<sub>2</sub>), 1.2-  
1.64 (M, 3H, cyclohexyl-CH<sub>2</sub>), 1.64-1.67 (M, 2H, cyclohexyl-CH<sub>2</sub>),  
1.75-1.85 (M, 1H, cyclohexyl-CH<sub>2</sub>), 2.03-2.1 (M, 1H, C4), 2.25-2.4  
20 (M, 1H, cyclohexylmethine), 2.40-2.55 (M, 1H, C4), 2.78 (S, 3H,  
N-methyl), 3.22 (dd, 1H, C2, <sup>2</sup>J=13.3 Hz, <sup>3</sup>J=0-1 Hz), 3.27-3.51  
(M, 2H, C5), 3.65 (dd, 1H, <sup>3</sup>J=5.42 Hz, <sup>2</sup>J=13.2 Hz, C2),  
4.42 (S, 2H, tartrate), 5.37 (M, 1 H, C3), 7.2-7.61 (M, 5H). The  
assignment was based on H,H COSY NMR spectra. <sup>13</sup>C-NMR (50 MHz  
25 CD<sub>4</sub>O/DEPT): δ (ppm) (26.71 (t), 27.35 (t), 27.47 (t), 28.71  
(t), cyclohexyl methylene), 31.8 (t, C4), 42.5 (q, N-methyl),

46.92 (d, cyclohexyl methine), 55.35 (t, C5), 61.24 (t, C2), 74.2 (d, tartrate methine), 75.2 (d, C3), 82.7 (s, hydroxy ester C2'), 126.9 (d), 128.7 (d), 129.2 (d), 142.1 (s), 175.0 (s, tartrate carboxyl), 177.2 (s, hydroxy ester carboxyl).

5

For quaternization, the procedure given in Example 1 is modified in that methyl bromide in tert-butyl methyl ether is used.

10 (3S, 2'S)-3-[(cyclohexylhydroxyphenylacetyl)oxy]-1,1-dimethylpyrrolidinium bromide 2a:  $^1\text{H-NMR}$  (300 MHz  $\text{CD}_4\text{O}$ ):  $\delta$  (ppm) (1.1-2.0 (M, 10H), cyclohexyl methylene), 2.1-2.3 (M, 1H, cHex methine), 2.35-2.45 (M, 1H, C4), 2.65-2.85 (M, 1H, C4), 3.07 (S, 3H, N-methyl), 3.21 (S, 3H, N-methyl), 3.55-3.8 (M, 3H, C2, C5),  
15 3.85 (dd, 1H, C2,  $^2J=13.8$  Hz,  $^3J=6.1$  Hz), 5.47 (M, 1H, C3), 7.25-7.4 (M, 3H), 7.55-7.65 (M, 2H)

The diastereomeric purity (de) was determined by comparing the integrals of the N-methyl protons of the diastereomeric  
20 hydrogen tartrates at 2.78 ppm and 2.78 ppm in the  $^1\text{H-NMR}$  spectra (300 MHz,  $\text{CD}_4\text{O}$ ).

#### Example 6:

25 Preparation of (3S, 2'R)-3-[(cyclohexylhydroxyphenylacetyl)oxy]-1,1-dimethylpyrrolidinium

bromide 2b (formula I, AR:= phenyl, R<sub>1</sub> = cyclohexyl, R<sub>2</sub> = R<sub>3</sub> = methyl, n = 1, A = Br)

From the mother liquors of the separation of the diastereomers for preparing (3S,2'S)-3-[(cyclohexylhydroxyphenylacetyl)oxy]-1,1-dimethylpyrrolidinium bromide (Example 5), the tertiary amino ester is liberated, after which the diastereomeric compound (3S,2'R)-3-[(cyclohexylhydroxyphenylacetyl)oxy]-1-methylpyrrolidine, D(-)-hydrogen tartrate, is crystallized.

(3S,2'R)-3-[(cyclohexylhydroxyphenylacetyl)oxy]-1-methylpyrrolidine, D(-)-hydrogen tartrate:

<sup>1</sup>H-NMR (300 MHz CD<sub>4</sub>O): δ(ppm) 1.12-1.2 (M,4H,cyclohexyl CH<sub>2</sub>), 1.2-1.64 (M,3H,cyclohexyl CH<sub>2</sub>), 1.64-1.67 (M,2H,cyclohexyl CH<sub>2</sub>), 1.75-1.85 (M,1H,cyclohexyl CH<sub>2</sub>), 2.03-2.08 (M,1H,C4), 2.25-2.4 (M,1H,cyclohexyl methine), 2.40-2.55 (M,1H,C4), 2.82 (S,3H, N methyl), 3.27-3.34 (M,2H,C5,C2), 3.44 (M,1H,C5), 3.73 (dd,1H,<sup>3</sup>J=5.4Hz,<sup>2</sup>J=13.3 Hz,C2), 4.42 (S,2H, tartrate), 5.37 (M,1H,C3), 7.2-7.61 (M,5H). Assignment based on H,H COSY-NMR.

20

<sup>13</sup>C NMR (62.5 MHz CD<sub>4</sub>O): δ(ppm) (25.31 (t), 26 (t), 26.1 (t), 27.32 (t), cyclohexyl methylene), 30.57 (t,C4), 41.1 (q,N-methyl), 45.6 (d, cyclohexyl methine), 53.93 (t,C5), 59.7 (t,C2), 72.8 (d,tartrate methine), 73.82 (d,C3), 81.3 (s, hydroxy ester C2'), 125.54 (d), 127.2(d), 127.8 (d), 140.85

25

(s), 173.64 (s, tartrate carboxyl), 175.8 (s, hydroxy ester carboxyl)

Quaternization using methyl bromide in tert-butyl methyl ether  
 5 gives (3S,2'R)-3-[(cyclohexylhydroxyphenylacetyl)oxy]-1,1 -  
 dimethylpyrrolidinium bromide.  $^1\text{H-NMR}$  (300 MHz  $\text{CD}_4\text{O}$ ):  $\delta$  (ppm)  
 (1.1-1.8 (M, 10H), cyclohexyl methylene), 2.2-2.4 (M, 2H, C4 & cHex  
 methine), 2.65-2.85 (M, 1H, C4), 3.03 (S, 3H, N-methyl), 3.21  
 (S, 3H, N-methyl), 3.55-3.8 (M, 3H, C2, C5), 3.86 (dd, 1 H, C2,  $^2J =$   
 10 13.8 Hz,  $^3J = 6.1$  Hz), 5.48 (M, 1H, C3), 7.25-7.4 (M, 3H), 7.57-  
 7.65 (M, 2H).

The diastereomeric purity (de) was determined as described in  
 Example 5.

15

#### Example 7:

Preparation of (3R,2'R)-3-

[(cyclohexylhydroxyphenylacetyl)oxy]-1,1-dimethylpyrrolidinium  
 20 bromide 2c (formula I, AR = phenyl,  $R_1$  = cyclohexyl,  $R_2$  =  $R_3$  =  
 methyl,  $n = 1$ , A = Br)

The compound of this Example 7 is prepared starting from (3R)-  
 1-methyl-3-pyrrolidinol, methyl 2-cyclohexyl-2-  
 25 hydroxyphenylacetate and NaOMe, using the process described in  
 Example 1. Transesterification and separation of the

diastereomers of the 3R-configured L-(+)-hydrogen tartrates is carried out in a similar manner. For quaternization, methyl bromide in tert-butyl methyl ether is employed, similar to the procedure given in Example 5. [1H] and [13C]-NMR analysis

5 identical to the (3S,2'S)-configured compound given in Example 5.

The diastereomeric purity (de) was determined as described in Example 5.

10

#### Example 8:

Preparation of (3R,2'S)-3-

15 [(cyclohexylhydroxyphenylacetyl)oxy]-1,1-dimethylpyrrolidinium bromide 2d (formula I, AR = phenyl, R<sub>1</sub> = cyclohexyl, R<sub>2</sub> = R<sub>3</sub> = methyl, n = 1, A = Br)

From the mother liquors of the separation of the diastereomers for preparing (3R,2'R)-3-[(cyclohexylhydroxyphenylacetyl)oxy]-

20 1,1-dimethylpyrrolidinium bromide (Example 7), the diastereomeric compound (3R,2'S)-3-

[(cyclohexylhydroxyphenylacetyl)oxy]-1-methylpyrrolidine L-(+)-hydrogen tartrate, is crystallized. Quaternization using methylbromide in tert-butyl methyl ether gives (3R,2'S)-3-

25 [(cyclohexylhydroxyphenylacetyl)oxy]-1,1-dimethylpyrrolidinium bromide. The [1H]- and [13C]-NMR analytical data correspond to

those of the (3S,2'R)-configured compound detailed in Example 6.

The diastereomeric purity (de) was determined as described in

5 Example 5.

Formulae of the enantiomers 2a-2d of Examples 5-8

# 10 Example 9:

Pharmacological data of compounds of the structural formula I where AR = phenyl, R<sub>1</sub> = cyclopentyl, n = 1, R<sub>2</sub> = R<sub>3</sub> = methyl, A = iodide

10 1 The absolute configuration in the 2 position of the hydroxy acids was assigned by comparing the CD spectra with the corresponding cyclohexylmandelic acids. The absolute configuration of the 2-cyclohexyl-2-hydroxyphenyl acetic acids was assigned using the optical rotations in accordance with  
15 T.D. Inch et al., J. Chem. Soc. 1968, pp.1693-1699.

Example 11a: - Preparation of an inhalable powder formulation affording a dose of 350 µg (3R,2'R)-3-

20 [cyclopentylhydroxyphenylacetyl)oxy]-1,1-dimethylpyrrolidinium bromide per 12.0 mg Powder formulation

3.50 g (3R,2'R)- 3-[cyclopentylhydroxyphenylacetyl)oxy]-1,1-dimethylpyrrolidinium bromide and 16.50 g PrismaLac 40 (alpha-  
25 Lactose monohydrate, Meggle) are premixed with a spatula and sieved through a 0.8 mm sieve. The sieved blend is filled in

a 250 ml glass flask and mixed for 20 min using a Turbula blender T10 B (W.A. Bachofen AG Maschinenfabrik, Basel) at 35 rpm.

- 5    Thereafter the blend is sieved a second time through the 0.8 mm sieve. Finally 100 g Lactose is added followed by blending the mixture with the Turbula blender for 20 min.

Content uniformity test data are for example: 97.4%, rsd.

- 10   (standard deviation) +/- 3.3%, n=10/respirable dose: stage 3-5, 33.3%, Astra Draco MSLI

Example 11b: - Preparation of an inhalable powder formulation affording a dose of 350  $\mu$ g (3R,2'S)- 3-

- 15   [cyclopentylhydroxyphenylacetyl)oxy]-1,1-dimethylpyrrolidinium bromide per 12.0 mg Powder formulation

3.50 g (3R,2'S)- 3-

- 20   [cyclopentylhydroxyphenylacetyl)oxy]-1,1-dimethylpyrrolidinium bromide and 16.50 g PrismaLac 40 (alpha-Lactose monohydrate, Meggle) are premixed with a spatula and sieved through a 0.8 mm sieve. The sieved blend is filled in a 250 ml glass flask and mixed for 20 min using a Turbula blender T10 B (W.A. Bachofen AG Maschinenfabrik, Basel) at 35 rpm.

Thereafter the blend is sieved a second time through the 0.8 mm sieve. Finally 100 g Lactose is added followed by blending the mixture with the Turbula blender for 20 min.

- 5 Content uniformity test data are for example: 97.4%, rsd.  
(standard deviation) +/- 3.3%, n=10/respirable dose: stage 3-  
5, 33.3%, Astra Draco MSLI

- Example 11c: - Preparation of an inhalable powder formulation  
10 affording a dose of 350 µg (3S,2'R)- 3-  
[cyclopentylhydroxyphenylacetyl)oxy]-1,1-dimethylpyrrolidinium  
bromide per 12.0 mg Powder formulation
- 3.50 g (3S,2'R)- 3-  
15 [cyclopentylhydroxyphenylacetyl)oxy]-1,1-dimethylpyrrolidinium  
bromide and 16.50 g PrismaLac 40 (alpha-Lactose monohydrate,  
Meggler) are premixed with a spatula and sieved through a 0.8  
mm sieve. The sieved blend is filled in a 250 ml glass flask  
and mixed for 20 min using a Turbula blender T10 B (W.A.  
20 Bachofen AG Maschinenfabrik, Basel) at 35 rpm.

Thereafter the blend is sieved a second time through the 0.8 mm sieve. Finally 100 g Lactose is added followed by blending the mixture with the Turbula blender for 20 min.

Content uniformity test data are for example: 97.4%, rsd.

(standard deviation) +/- 3.3%, n=10/respirable dose: stage 3-5, 33.3%, Astra Draco MSLI

5 Example 11d: - Preparation of an inhalable powder formulation affording a dose of 350 µg (3S,2'S)-3-[cyclopentylhydroxyphenylacetyl)oxy]-1,1-dimethylpyrrolidinium bromide per 12.0 mg Powder formulation

10 3.50 g (3S,2'S)-3-[cyclopentylhydroxyphenylacetyl)oxy]-1,1-dimethylpyrrolidinium bromide and 16.50 g PrismaLac 40 (alpha-Lactose monohydrate, Meggle) are premixed with a spatula and sieved through a 0.8 mm sieve. The sieved blend is filled in a 250 ml glass flask  
15 and mixed for 20 min using a Turbula blender T10 B (W.A. Bachofen AG Maschinenfabrik, Basel) at 35 rpm.

Thereafter the blend is sieved a second time through the 0.8 mm sieve. Finally 100 g Lactose is added followed by blending  
20 the mixture with the Turbula blender for 20 min.

Content uniformity test data are for example: 97.4%, rsd.

(standard deviation) +/- 3.3%, n=10/respirable dose: stage 3-5, 33.3%, Astra Draco MSLI

Example 12a: - Preparation of an inhalable powder formulation affording a dose of 350  $\mu$ g (3R,2'R)-3-[cyclopentylhydroxyphenylacetyl)oxy]-1,1-dimethylpyrrolidinium bromide per 11.65 mg Powder formulation

5

0.825 g Pharmatose 450 M (alpha-Lactose monohydrate, DMV) and 32.18 g CapsuLac 60 (alpha-Lactose monohydrate, Meggle) is premixed with a spatula and sieved through a 0.3 mm sieve. The resulting blend is filled in a 100 ml glass flask and then  
10 blended with the Turbula blender T10 B for 60 min. 7.00 g (3R,2'R)- 3-[cyclopentylhydroxyphenylacetyl)oxy]-1,1-dimethylpyrrolidinium bromide and the 33.0 g Lactose blend is premixed with a spatula for 2 min and sieved through a 0.3 mm sieve. The sieved blend is filled in a 500 ml glass flask and  
15 mixed for 30 min using the Turbula blender. After adding 200 g CapsuLac 60 the blend is blended a second time with the Turbula blender for 10 min.

Content uniformity test data are for example: 99.8%, rsd. +/-  
20 3.2%, n=10

Example 12b: - Preparation of an inhalable powder formulation affording a dose of 350  $\mu$ g (3R,2'S)- 3-[cyclopentylhydroxyphenylacetyl)oxy]-1,1-dimethylpyrrolidinium  
25 bromide per 11.65 mg Powder formulation

0.825 g Pharmatose 450 M (alpha-Lactose monohydrate, DMV) and 32.18 g CapsuLac 60 (alpha-Lactose monohydrate, Meggle) is premixed with a spatula and sieved through a 0.3 mm sieve.

The resulting blend is filled in a 100 ml glass flask and then

5 blended with the Turbula blender T10 B for 60 min. 7.00 g

(3R,2'S)- 3-[cyclopentylhydroxyphenylacetyl)oxy]-1,1-

dimethylpyrrolidinium bromide and the 33.0 g Lactose blend is

premixed with a spatula for 2 min and sieved through a 0.3 mm

sieve. The sieved blend is filled in a 500 ml glass flask and

10 mixed for 30 min using the Turbula blender. After adding 200

g CapsuLac 60 the blend is blended a second time with the

Turbula blender for 10 min.

Content uniformity test data are for example: 99.8%, rsd. +/-

15 3.2%, n=10.

Example 12c: - Preparation of an inhalable powder formulation affording a dose of 350  $\mu$ g (3S,2'R)- 3-

[cyclopentylhydroxyphenylacetyl)oxy]-1,1-dimethylpyrrolidinium

20 bromide per 11.65 mg Powder formulation

0.825 g Pharmatose 450 M (alpha-Lactose monohydrate, DMV) and

32.18 g CapsuLac 60 (alpha-Lactose monohydrate, Meggle) is

premixed with a spatula and sieved through a 0.3 mm sieve.

25 The resulting blend is filled in a 100 ml glass flask and then

blended with the Turbula blender T10 B for 60 min. 7.00 g

(3S,2'R) - 3-[cyclopentylhydroxyphenylacetyl)oxy]-1,1-

dimethylpyrrolidinium bromide and the 33.0 g Lactose blend is premixed with a spatula for 2 min and sieved through a 0.3 mm sieve. The sieved blend is filled in a 500 ml glass flask and  
5 mixed for 30 min using the Turbula blender. After adding 200 g CapsuLac 60 the blend is blended a second time with the Turbula blender for 10 min.

Content uniformity test data are for example: 99.8%, rsd. +/-

10 3.2%, n=10

Example 12d: - Preparation of an inhalable powder formulation affording a dose of 350  $\mu$ g (3S,2'S)-3-

[cyclopentylhydroxyphenylacetyl)oxy]-1,1-dimethylpyrrolidinium  
15 bromide per 11.65 mg Powder formulation

0.825 g Pharmatose 450 M (alpha-Lactose monohydrate, DMV) and 32.18 g CapsuLac 60 (alpha-Lactose monohydrate, Meggle) is premixed with a spatula and sieved through a 0.3 mm sieve.

20 The resulting blend is filled in a 100 ml glass flask and then blended with the Turbula blender T10 B for 60 min. 7.00 g

(3S,2'S)-3-[cyclopentylhydroxyphenylacetyl)oxy]-1,1-

dimethylpyrrolidinium bromide and the 33.0 g Lactose blend is premixed with a spatula for 2 min and sieved through a 0.3 mm

25 sieve. The sieved blend is filled in a 500 ml glass flask and mixed for 30 min using the Turbula blender. After adding 200

g CapsuLac 60 the blend is blended a second time with the  
Turbula blender for 10 min.

Content uniformity test data are for example: 99.8%, rsd. +/-  
5 3.2%, n=10

Example 13a: - Preparation of an inhalable powder formulation  
affording a dose of 700  $\mu$ g (3R,2'R)-3-  
10 [cyclopentylhydroxyphenylacetyl)oxy]-1,1-dimethylpyrrolidinium  
bromide per 13.0 mg Powder formulation

14.0 g (3R,2'R)-3-[cyclopentylhydroxyphenylacetyl)oxy]-1,1-  
dimethylpyrrolidinium bromide and 46.0 g InhaLac 70 (alpha-  
15 Lactose monohydrate, Meggle) are premixed with a spatula and  
sieved through a 0.5 mm sieve. The sieved blend is filled in  
a 500 ml glass flask and mixed for 30 min using a Turbula  
blender. Finally 200 g Lactose is added followed by blending  
the mixture with the Turbula blender for 10 min.

20 Content uniformity test data are for example: 97.2%, rsd. +/-  
0.6%, n=10/respirable dose: stage 3-5, 50.9%, Astra Draco MSLI

Example 13b: - Preparation of an inhalable powder formulation  
25 affording a dose of 700  $\mu$ g (3R,2'S)-3-

[cyclopentylhydroxyphenylacetyl)oxy]-1,1-dimethylpyrrolidinium  
bromide per 13.0 mg Powder formulation

14.0 g (3R,2'S)- 3-[cyclopentylhydroxyphenylacetyl)oxy]-1,1-  
5 dimethylpyrrolidinium bromide and 46.0 g InhaLac 70 (alpha-  
Lactose monohydrate, Meggle) are premixed with a spatula and  
sieved through a 0.5 mm sieve. The sieved blend is filled in  
a 500 ml glass flask and mixed for 30 min using a Turbula  
blender. Finally 200 g Lactose is added followed by blending  
10 the mixture with the Turbula blender for 10 min.

Content uniformity test data are for example: 97.2%, rsd. +/-  
0.6%, n=10/respirable dose: stage 3-5, 50.9%, Astra Draco MSLI

15 Example 13c: - Preparation of an inhalable powder formulation  
affording a dose of 700  $\mu$ g (3S,2'R)- 3-

[cyclopentylhydroxyphenylacetyl)oxy]-1,1-dimethylpyrrolidinium  
bromide per 13.0 mg Powder formulation

20 14.0 g (3S,2'R)-3-[cyclopentylhydroxyphenylacetyl)oxy]-1,1-  
dimethylpyrrolidinium bromide and 46.0 g InhaLac 70 (alpha-  
Lactose monohydrate, Meggle) are premixed with a spatula and  
sieved through a 0.5 mm sieve. The sieved blend is filled in  
a 500 ml glass flask and mixed for 30 min using a Turbula  
25 blender. Finally 200 g Lactose is added followed by blending  
the mixture with the Turbula blender for 10 min.

Content uniformity test data are for example: 97.2%, rsd. +/- 0.6%, n=10/respirable dose: stage 3-5, 50.9%, Astra Draco MSLI

Example 13d: - Preparation of an inhalable powder formulation

5 affording a dose of 700  $\mu$ g (3S,2'S)-3-[cyclopentylhydroxyphenylacetyl]oxy]-1,1-dimethylpyrrolidinium bromide per 13.0 mg Powder formulation

14.0 g (3S,2'S)-3-[cyclopentylhydroxyphenylacetyl]oxy]-1,1-dimethylpyrrolidinium bromide and 46.0 g InhaLac 70 (alpha-Lactose monohydrate, Meggle) are premixed with a spatula and  
10 sieved through a 0.5 mm sieve. The sieved blend is filled in a 500 ml glass flask and mixed for 30 min using a Turbula blender. Finally 200 g Lactose is added followed by blending  
15 the mixture with the Turbula blender for 10 min.

Content uniformity test data are for example: 97.2%, rsd. +/- 0.6%, n=10/respirable dose: stage 3-5, 50.9%, Astra Draco MSLI

20

Example 14a: - Preparation of an inhalable powder formulation

affording a dose of 350  $\mu$ g (3R,2'R)-3-[cyclohexylhydroxyphenylacetyl]oxy]-1,1-dimethylpyrrolidinium bromide per 12.0 mg Powder formulation

25

3.50 g (3R,2'R)- 3-[cyclohexylhydroxyphenylacetyl)oxy]-1,1-dimethylpyrrolidinium bromide and 16.50 g PrismaLac 40 (alpha-Lactose monohydrate, Meggle) are premixed with a spatula and sieved through a 0.8 mm sieve. The sieved blend is filled in  
5 a 250 ml glass flask and mixed for 20 min using a Turbula blender T10 B (W.A. Bachofen AG Maschinenfabrik, Basel) at 35 rpm

Thereafter the blend is sieved a second time through the 0.8  
10 mm sieve. Finally 100 g Lactose is added followed by blending the mixture with the Turbula blender for 20 min.

Content uniformity test data are for example: 97.4%, rsd. +/- 3.3%, n=10/respirable dose: stage 3-5, 33.3%, Astra Draco MSLI

15

Example 14b: - Preparation of an inhalable powder formulation affording a dose of 350µg 3R,2'S)- 3-[cyclohexylhydroxyphenylacetyl)oxy]-1,1-dimethylpyrrolidinium bromide per 12.0 mg Powder formulation

20

3.50 g (3R,2'S)- 3-[cyclohexylhydroxyphenylacetyl)oxy]-1,1-dimethylpyrrolidinium bromide and 16.50 g PrismaLac 40 (alpha-Lactose monohydrate, Meggle) are premixed with a spatula and sieved through a 0.8 mm sieve. The sieved blend is filled in  
25 a 250 ml glass flask and mixed for 20 min using a Turbula

blender T10 B (W.A. Bachofen AG Maschinenfabrik, Basel) at 35 rpm

Thereafter the blend is sieved a second time through the 0.8 mm sieve. Finally 100 g Lactose is added followed by blending the mixture with the Turbula blender for 20 min.

Content uniformity test data are for example: 97.4%, rsd. +/- 3.3%, n=10/respirable dose: stage 3-5, 33.3%, Astra Draco MSLI

10

Example 14c: - Preparation of an inhalable powder formulation affording a dose of 350 $\mu$ g (3S 2'R)- 3-[cyclohexylhydroxyphenylacetyl)oxy]-1,1-dimethylpyrrolidinium bromide per 12.0 mg Powder formulation

15

3.50 g (3S,2'R)- 3-[cyclohexylhydroxyphenylacetyl)oxy]-1,1-dimethylpyrrolidinium bromide and 16.50 g PrismaLac 40 (alpha-Lactose monohydrate, Meggle) are premixed with a spatula and sieved through a 0.8 mm sieve. The sieved blend is filled in a 250 ml glass flask and mixed for 20 min using a Turbula blender T10 B (W.A. Bachofen AG Maschinenfabrik, Basel) at 35 rpm

Thereafter the blend is sieved a second time through the 0.8 mm sieve. Finally 100 g Lactose is added followed by blending the mixture with the Turbula blender for 20 min.

Content uniformity test data are for example: 97.4%, rsd. +/- 3.3%, n=10/respirable dose: stage 3-5, 33.3%, Astra Draco MSLI

Example 14d:- Preparation of an inhalable powder formulation

5 affording a dose of 350 $\mu$ g (3S,2'S)-3-

[cyclohexylhydroxyphenylacetyl)oxy]-1,1-dimethylpyrrolidinium bromide per 12.0 mg Powder formulation

3.50 g (3S,2'S)-3-[cyclohexylhydroxyphenylacetyl)oxy]-1,1-

10 dimethylpyrrolidinium bromide and 16.50 g PrismaLac 40 (alpha-Lactose monohydrate, Meggle) are premixed with a spatula and sieved through a 0.8 mm sieve. The sieved blend is filled in a 250 ml glass flask and mixed for 20 min using a Turbula blender T10 B (W.A. Bachofen AG Maschinenfabrik, Basel) at 35

15 rpm

Thereafter the blend is sieved a second time through the 0.8 mm sieve. Finally 100 g Lactose is added followed by blending the mixture with the Turbula blender for 20 min.

20 Content uniformity test data are for example: 97.4%, rsd. +/- 3.3%, n=10/respirable dose: stage 3-5, 33.3%, Astra Draco MSLI

25 Example 15a:- Preparation of an inhalable powder formulation

affording a dose of 350  $\mu$ g (3R,2'R)- 3-

[cyclohexylhydroxyphenylacetyl)oxy]-1,1-dimethylpyrrolidinium  
bromide per 11.65 mg Powder formulation

0.825 g Pharmatose 450 M (alpha-Lactose monohydrate, DMV) and

5 32.18 g CapsuLac 60 (alpha-Lactose monohydrate, Meggle) is

premixed with a spatula and sieved through a 0.3 mm sieve.

The resulting blend is filled in a 100 ml glass flask and then  
blended with the Turbula blender T10 B for 60 min.

7.00 g (3R,2'R)- 3-

10 [cyclohexylhydroxyphenylacetyl)oxy]-1,1-dimethylpyrrolidinium

bromide and the 33.0 g Lactose blend is premixed with a

spatula for 2 min and sieved through a 0.3 mm sieve. The

sieved blend is filled in a 500 ml glass flask and mixed for

30 min using the Turbula blender. After adding 200 g CapsuLac

15 60 the blend is blended a second time with the Turbula blender  
for 10 min.

Content uniformity test data are for example: 99.8%, rsd. +/-

3.2%, n=10

20

Example 15b: - Preparation of an inhalable powder formulation  
affording a dose of 350µg (3R,2'S)- 3-

[cyclohexylhydroxyphenylacetyl)oxy]-1,1-dimethylpyrrolidinium  
bromide per 11.65 mg Powder formulation

25

0.825 g Pharmatose 450 M (alpha-Lactose monohydrate, DMV) and  
32.18 g CapsuLac 60 (alpha-Lactose monohydrate, Meggle) is  
premixed with a spatula and sieved through a 0.3 mm sieve.  
The resulting blend is filled in a 100 ml glass flask and then  
5 blended with the Turbula blender T10 B for 60 min.

7.00 g (3R,2'S)-3-

[cyclohexylhydroxyphenylacetyl)oxy]-1,1-dimethylpyrrolidinium  
bromide and the 33.0 g Lactose blend is premixed with a  
10 spatula for 2 min and sieved through a 0.3 mm sieve. The  
sieved blend is filled in a 500 ml glass flask and mixed for  
30 min using the Turbula blender. After adding 200 g CapsuLac  
60 the blend is blended a second time with the Turbula blender  
for 10 min.

15 Content uniformity test data are for example: 99.8%, rsd. +/-  
3.2%, n=10

Example 15c: - Preparation of an inhalable powder formulation

20 affording a dose of 350 µg (3S,2'R)- 3-

[cyclohexylhydroxyphenylacetyl)oxy]-1,1-dimethylpyrrolidinium  
bromide per 11.65 mg Powder formulation

0.825 g Pharmatose 450 M (alpha-Lactose monohydrate, DMV) and  
25 32.18 g CapsuLac 60 (alpha-Lactose monohydrate, Meggle) is  
premixed with a spatula and sieved through a 0.3 mm sieve.

The resulting blend is filled in a 100 ml glass flask and then blended with the Turbula blender T10 B for 60 min.

7.00 g (3S,2'R)-3-

[cyclohexylhydroxyphenylacetyl)oxy]-1,1-dimethylpyrrolidinium

5 bromide and the 33.0 g Lactose blend is premixed with a spatula for 2 min and sieved through a 0.3 mm sieve. The sieved blend is filled in a 500 ml glass flask and mixed for 30 min using the Turbula blender. After adding 200 g CapsuLac 60 the blend is blended a second time with the Turbula blender  
10 for 10 min.

Content uniformity test data are for example: 99.8%, rsd. +/- 3.2%, n=10

15 Example 15d: - Preparation of an inhalable powder formulation affording a dose of 350 $\mu$ g (3S,2'S)-3-

[cyclohexylhydroxyphenylacetyl)oxy]-1,1-dimethylpyrrolidinium bromide per 11.65 mg Powder formulation

20 0.825 g Pharmatose 450 M (alpha-Lactose monohydrate, DMV) and 32.18 g CapsuLac 60 (alpha-Lactose monohydrate, Meggle) is premixed with a spatula and sieved through a 0.3 mm sieve. The resulting blend is filled in a 100 ml glass flask and then blended with the Turbula blender T10 B for 60 min.

25

7.00 g (3S,2'S)-3-

[cyclohexylhydroxyphenylacetyl)oxy]-1,1-dimethylpyrrolidinium  
bromide and the 33.0 g Lactose blend is premixed with a  
spatula for 2 min and sieved through a 0.3 mm sieve. The  
sieved blend is filled in a 500 ml glass flask and mixed for  
5 30 min using the Turbula blender. After adding 200 g CapsuLac  
60 the blend is blended a second time with the Turbula blender  
for 10 min.

Content uniformity test data are for example: 99.8%, rsd. +/-

10 3.2%, n=10

Example 16a: - Preparation of an inhalable powder formulation  
affording a dose of 700  $\mu$ g (3R,2'R)-3-

15 [cyclohexylhydroxyphenylacetyl)oxy]-1,1-dimethylpyrrolidinium  
bromide per 13.0 mg Powder formulation

14.0 g (3R,2'R)- 3-[cyclohexylhydroxyphenylacetyl)oxy]-1,  
1-dimethylpyrrolidinium bromide and 46.0 g InhaLac 70 (alpha-  
20 Lactose monohydrate, Meggle) are premixed with a spatula and  
sieved through a 0.5 mm sieve. The sieved blend is filled in  
a 500 ml glass flask and mixed for 30 min using a Turbula  
blender. Finally 200 g Lactose is added followed by blending  
the mixture with the Turbula blender for 10 min.

Content uniformity test data are for example, 97.2%, rsd. +/- 0.6%, n=10/respirable dose: stage 3-5, 50.9%, Astra Draco MSLI

Example 16b: - Preparation of an inhalable powder formulation

5 affording a dose of 700  $\mu$ g (3R,2'S)- 3-

[cyclohexyhydroxyphenylacetyl)oxy]-1,1-dimethylpyrrolidinium  
bromide per 13.0 mg Powder formulation

14.0 g (3R,2'S)-3-[cyclohexylhydroxyphenylacetyl)oxy]-1,1-  
10 dimethylpyrrolidinium bromide and 46.0 g InhaLac 70 (alpha-  
Lactose monohydrate, Meggle) are premixed with a spatula and  
sieved through a 0.5 mm sieve. The sieved blend is filled in  
a 500 ml glass flask and mixed for 30 min using a Turbula  
blender. Finally 200 g Lactose is added followed by blending  
15 the mixture with the Turbula blender for 10 min.

Content uniformity test data are for example, 97.2%, rsd. +/- 0.6%, n=10/respirable dose: stage 3-5, 50.9%, Astra Draco MSLI

Example 16c: - Preparation of an inhalable powder formulation

20 affording a dose of 700  $\mu$ g (3S,2'R)-

3-[cyclohexyhydroxyphenylacetyl)oxy]-1,1-dimethylpyrrolidinium  
bromide per 13.0 mg Powder formulation

14.0 g (3S,2'R)- 3-[cyclohexylhydroxyphenylacetyl)oxy]-1,1-  
25 dimethylpyrrolidinium bromide and 46.0 g InhaLac 70 (alpha-  
Lactose monohydrate, Meggle) are premixed with a spatula and

sieved through a 0.5 mm sieve. The sieved blend is filled in a 500 ml glass flask and mixed for 30 min using a Turbula blender. Finally 200 g Lactose is added followed by blending the mixture with the Turbula blender for 10 min.

5

Content uniformity test data are for example, 97.2%, rsd. +/- 0.6%, n=10/respirable dose: stage 3-5, 50.9%, Astra Draco MSLI

Example 16d: - Preparation of an inhalable powder formulation

10 affording a dose of 700 µg (3S,2'S)-3-

[cyclohexyhydroxyphenylacetyl)oxy]-1,1-dimethylpyrrolidinium bromide per 13.0 mg Powder formulation

14.0 g (3S, 2'S)-3-[cyclohexylhydroxyphenylacetyl)oxy]-1,1-  
15 dimethylpyrrolidinium bromide and 46.0 g InhaLac 70 (alpha-Lactose monohydrate, Meggle) are premixed with a spatula and sieved through a 0.5 mm sieve. The sieved blend is filled in a 500 ml glass flask and mixed for 30 min using a Turbula blender. Finally 200 g Lactose is added followed by blending  
20 the mixture with the Turbula blender for 10 min.

Content uniformity test data are for example, 97.2%, rsd. +/- 0.6%, n=10/respirable dose: stage 3-5, 50.9%, Astra Draco MSLI

Example 17: - Preparation of an inhalable powder formulation  
affording a dose of 175  $\mu$ g (3R,2'R)-3-  
[cyclopentylhydroxyphenylacetyl)oxy]-1,1-dimethylpyrrolidinium  
bromide per 12.0 mg Powder formulation

5

1.75 g (3R,2'R)-3-[cyclopentylhydroxyphenylacetyl)oxy]-1,1-  
dimethylpyrrolidinium bromide and 16.50 g PrismaLac 40 (alpha-  
Lactose monohydrate, Meggle) are premixed with a spatula and  
sieved through a 0.8 mm sieve. The sieved blend is filled in a  
10 250 ml glass flask and mixed for 20 min using a Turbula  
blender T10 B (W.A. Bachofen AG Maschinenfabrik, Basel) at 35  
rpm

Thereafter the blend is sieved a second time through the 0.8  
15 mm sieve. Finally 100 g lactose is added followed by blending  
the mixture with the turbula blender for 20 min.

Content uniformity test data are for example: 97.4%, rsd. +/-  
3.3%, n=10/respirable dose: stage 3-5, 33.3%, Astra Draco MSLI

20

Example 18: - Preparation of an inhalable powder formulation  
affording a dose of 175  $\mu$ g (3R,2'R)-3-  
[cyclopentylhydroxyphenylacetyl)oxy]-1,1-dimethylpyrrolidinium  
bromide per 11.65 mg Powder formulation

25

0.825 g Pharmatose 450 M (alpha-Lactose monohydrate, DMV) and 32.18 g CapsuLac 60 (alpha-Lactose monohydrate, Meggle) is premixed with a spatula and sieved through a 0.3 mm sieve.

The resulting blend is filled in a 100 ml glass flask and then  
5 blended with the Turbula blender T10 B for 60 min.

3.50 g (3R,2'R)-3-[cyclopentylhydroxyphenylacetyl)oxy]-1,1-dimethylpyrrolidinium bromide and the 33.0 g Lactose blend is premixed with a spatula for 2 min and sieved through a 0.3 mm  
10 sieve. The sieved blend is filled in a 500 ml glass flask and mixed for 30 min using the Turbula blender. After adding 200 g CapsuLac 60 the blend is blended a second time with the Turbula blender for 10 min.

15 Content uniformity test data are for example: 99.8%, rsd. +/- 3.2%, n=10

Example 19: - Preparation of an inhalable powder formulation

20 affording a dose of 350 µg (3R,2'R)-3-

[cyclopentylhydroxyphenylacetyl)oxy]-1,1-dimethylpyrrolidinium bromide per 13.0 mg Powder formulation

7.0 g (3R,2'R)-3-[cyclopentylhydroxyphenylacetyl)oxy]-1,1-

25 dimethylpyrrolidinium bromide and 46.0 g InhaLac 70 (alpha-Lactose monohydrate, Meggle) are premixed with a spatula and

sieved through a 0.5 mm sieve. The sieved blend is filled in a 500 ml glass flask and mixed for 30 min using a Turbula blender. Finally 200 g Lactose is added followed by blending the mixture with the Turbula blender for 10 min.

5

Content uniformity test data are for example: 97.2%, rsd. +/- 0.6%. n=10/respirable dose: stage 3-5, 50.9%, Astra Draco, MSLI

10

Example 20: - Preparation of an inhalable powder formulation affording a dose of 175  $\mu$ g (3R,2'R)-3-[cyclohexylhydroxyphenylacetyl)oxy]-1,1-dimethylpyrrolidinium bromide per 12.0 mg Powder formulation

15

1.75 g (3R,2'R)-3-[cyclohexylhydroxyphenylacetyl)oxy]-1,1-dimethylpyrrolidinium bromide and 16.50 g PrismaLac 40 (alpha-Lactose monohydrate, Meggle) are premixed with a spatula and sieved through a 0.8 mm sieve. The sieved blend is filled in a 250 ml glass flask and mixed for 20 min using a Turbula blender T10 B (W.A. Bachofen AG Maschinenfabrik, Basel) at 35 rpm.

20

Thereafter the blend is sieved a second time through the 0.8 mm sieve. Finally 100 g Lactose is added followed by blending the mixture with the Turbula blender for 20 min.

25

Content uniformity test data are for example: 97.4%, rsd. +/- 3.3%, n=10/respirable dose: stage 3-5, 33.3 %, Astra Draco, MSLI.

5

Example 21: - Preparation of an inhalable powder formulation affording a dose of 175  $\mu$ g (3R, 2'R)-3-[cyclohexylhydroxyphenylacetyl)oxy]-1,1-dimethylpyrrolidinium bromide per 11.65 mg Powder formulation

10

0.825 g Pharmatose 450 M (alpha-Lactose monohydrate, DMV) and 32.18 g CapsuLac 60 (alpha-Lactose monohydrate, Meggle) is premixed with a spatula and sieved through a 0.3 mm sieve. The resulting blend is filled in a 100 ml glass flask and then  
15 blended with the Turbula blender T10\B for 60 min.

20

3.50 g (3R,2'R)-3-[cyclohexylhydroxyphenylacetyl)oxy]-1,1-dimethylpyrrolidinium bromide and the 33.0 g Lactose blend is premixed with a spatula for 2 min and sieved through a 0.3 mm  
20 sieve. The sieved blend is filled in a 500 ml glass flask and mixed for 30 min using the Turbula blender. After adding 200 g CapsuLac 60 the blend is blended a second time with the Turbula blender for 10 min.

25

Content uniformity test data are for example: 99.8%, rsd. +/- 3.2%, n=10

Example 22: - Preparation of an inhalable powder formulation affording a dose of 350  $\mu$ g (3R,2'R)-3-[cyclohexylhydroxyphenylacetyl)oxy]-1,1-dimethylpyrrolidinium bromide/13.0 mg Powder formulation

5

7.0 g (3R,2'R)-3-[cyclohexylhydroxyphenylacetyl)oxy]-1,1-dimethylpyrrolidinium bromide and 46.0 g InhaLac 70 (alpha-Lactose monohydrate, Meggle) are premixed with a spatula and sieved through a 0.5 mm sieve. The sieved blend is filled in  
10 a 500 ml glass flask and mixed for 30 min using a Turbula blender. Finally 200 g Lactose is added followed by blending the mixture with the Turbula blender for 10 min.

Content uniformity test data are for example: 97.2% rsd. +/-  
15 0.6%, n=10/respirable dose: stage 3-5, 50.9%, Astra Draco MSLI

Example 23a: - Preparation of an aerosol formulation affording a dose of 350  $\mu$ g (3R,2'R)3-

20 [cyclopentylhydroxyphenylacetyl)oxy]-1,1-dimethylpyrrolidinium bromide per stroke (0.052 ml Suspension)

1000 g 2H-Heptafluoropropane (=HFA 227) are cooled to a temperature of about 55°C and reacted with stirring with a  
25 solution of 10.32 g polyoxyethylene-25-glyceryl trioleate (trade name: Tagat<sup>R</sup> TO, Goldschmidt AG) in 10.32 g absolute

ethanol. 5.16 g micronized (3R,2'R)-3-[cyclopentylhydroxyphenylacetyl]oxy]-1,1-dimethylpyrrolidinium bromide and 5.90 g peppermint oil are then added and the resultant suspension is intensively homogenized. With further stirring and cooling the suspension is made up to 1032 g with cooled propellant 227 and then filled into metal cans which are closed with dosage valves that release 52  $\mu$ l of the suspension per stroke. Each stroke releases 350  $\mu$ g (3R,2'R)- or (3R,2'S)- or (3S,2'R)- or (3S,4'S)-3-[cyclopentylhydroxyphenylacetyl]oxy]-1,1-dimethylpyrrolidinium bromide.

Example 23b: - Preparation of an aerosol formulation affording a dose of 350  $\mu$ g (3R,2'S)- 3-

[cyclopentylhydroxyphenylacetyl]oxy]-1,1-dimethylpyrrolidinium bromide per stroke (0.052 ml Suspension)

1000 g 2H-Heptafluoropropane (=HFA 227) are cooled to a temperature of about minus 55°C and reacted with stirring with a solution of 10.32 g polyoxyethylene-25-glyceryl trioleate (trade name: Tagat<sup>R</sup> TO, Goldschmidt AG) in 10.32 g absolute ethanol. 5.16 g micronized (3R,2S)- 3-

[cyclopentylhydroxyphenylacetyl]oxy]-1,1-dimethylpyrrolidinium bromide and 5.90 g peppermint oil are then added and the resultant suspension is intensively homogenized. With further stirring and cooling the suspension is made up to 1032 g with

cooled propellant 227 and then filled into metal cans which are closed with dosage valves that release 52  $\mu$ l of the suspension per stroke. Each stroke releases 350  $\mu$ g (3R,2'R)- 3-[cyclopentylhydroxyphenylacetyl)oxy]-1,1-dimethylpyrrolidinium bromide.

Example 23c: - Preparation of an aerosol formulation affording a dose of 350  $\mu$ g (3S,2'R)- 3-

[cyclopentylhydroxyphenylacetyl)oxy]-1,1-dimethylpyrrolidinium bromide per stroke (0.052 ml Suspension)

1000 g 2H-Heptafluoropropane (=HFA 227) are cooled to a temperature of about minus 55°C and reacted with stirring with a solution of 10.32 g polyoxyethylene-25-glyceryl trioleate (trade name: Tagat<sup>R</sup> TO, Goldschmidt AG) in 10.32 g absolute ethanol. 5.16 g micronized (3S,2'R)- 3-

[cyclopentylhydroxyphenylacetyl)oxy]-1,1-dimethylpyrrolidinium bromide and 5.90 g peppermint oil are then added and the resultant suspension is intensively homogenized. With further stirring and cooling the suspension is made up to 1032 g with cooled propellant 227 and then filled into metal cans which are closed with dosage valves that release 52  $\mu$ l of the suspension per stroke. Each stroke releases 350  $\mu$ g (3S,2'R)- 3-[cyclopentylhydroxyphenylacetyl)oxy]-1,1-dimethylpyrrolidinium bromide.

Example 23d: - Preparation of an aerosol formulation affording a dose of 350  $\mu$ g (3S,2'S)-3-

[cyclopentylhydroxyphenylacetyl)oxy]-1,1-dimethylpyrrolidinium bromide per stroke (0.052 ml Suspension)

5

1000 g 2H-Heptafluoropropane (=HFA 227) are cooled to a temperature of about minus 55°C and reacted with stirring with a solution of 10.32 g polyoxyethylene-25-glyceryl trioleate (trade name: Tagat<sup>R</sup> TO, Goldschmidt AG) in 10.32 g absolute

10 ethanol. 5.16 g (3S,2'S)-3-

[cyclopentylhydroxyphenylacetyl)oxy]-1,1-dimethylpyrrolidinium bromide and 5.90 g peppermint oil are then added and the

resultant suspension is intensively homogenized. With further stirring and cooling the suspension is made up to 1032 g with

15 cooled propellant 227 and then filled into metal cans which are closed with dosage valves that release 52  $\mu$ l of the

suspension per stroke. Each stroke releases 350  $\mu$ g (3S,4'S)-

3-[cyclopentylhydroxyphenylacetyl)oxy]-1,1-dimethylpyrrolidinium bromide.

20

Example 24a: - Preparation of an aerosol formulation affording a dose of 350  $\mu$ g (3R,2'R)- 3-

[cyclohexylhydroxyphenylacetyl)oxy]-1,1-dimethylpyrrolidinium bromide per stroke (0.062 ml Suspension)

25

1000 g 2H-Heptafluoropropane (=HFA 227) are cooled to a temperature of about minus 55°C and reacted with stirring with a solution of 10.32 g polyoxyethylene-25-glyceryl trioleate (trade name: Tagat<sup>R</sup> TO, Goldschmidt AG) in 10.32 g absolute ethanol. 5.16 g micronized (3R,2'R)-3-[cyclohexylhydroxyphenylacetyl]oxy]-1,1-dimethylpyrrolidinium bromide and 5.90 g peppermint oil are then added and the resultant suspension is intensively homogenized. With further stirring and cooling the suspension is made up to 1032 g with cooled propellant 227 and then filled into metal cans which are closed with dosage valves that release 52 µl of the suspension per stroke. Each stroke releases 350 µg (3R,2'R)-3-[cyclohexylhydroxyphenylacetyl]oxy]-1,1-dimethylpyrrolidinium bromide.

Example 24b: - Preparation of an aerosol formulation affording a dose of 350 µg (3R,2'S)-3-[cyclohexylhydroxyphenylacetyl]oxy]-1,1-dimethylpyrrolidinium bromide per stroke (0.062 ml Suspension)

1000 g 2H-Heptafluoropropane (=HFA 227) are cooled to a temperature of about minus 55°C and reacted with stirring with a solution of 10.32 g polyoxyethylene-25-glyceryl trioleate (trade name: Tagat<sup>R</sup> TO, Goldschmidt AG) in 10.32 g absolute ethanol. 5.16 g micronized (3R,2'S)-3-[cyclohexylhydroxyphenylacetyl]oxy]-1,1-dimethylpyrrolidinium

bromid and 5.90 g peppermint oil are then added and the resultant suspension is intensively homogenized. With further stirring and cooling the suspension is made up to 1032 g with cooled propellant 227 and then filled into metal cans which  
5 are closed with dosage valves that release 52  $\mu$ l of the suspension per stroke. Each stroke releases 350  $\mu$ g (3R,2'S)-3-[cyclohexylhydroxyphenylacetyl)oxy]-1,1-dimethylpyrrolidinium bromide.

10 Example 24c: - Preparation of an aerosol formulation affording a dose of 350  $\mu$ g (3S,2'R)-3-[cyclohexylhydroxyphenylacetyl)oxy]-1,1-dimethylpyrrolidinium bromide per stroke (0.062 ml Suspension)

15 1000 g 2H-Heptafluoropropane (=HFA 227) are cooled to a temperature of about minus 55°C and reacted with stirring with a solution of 10.32 g polyoxyethylene-25-glyceryl trioleate (trade name: Tagat<sup>R</sup> TO, Goldschmidt AG) in 10.32 g absolute ethanol. 5.16 g micronized (3S,2'R)-3-[cyclohexylhydroxyphenylacetyl)oxy]-1,1-dimethylpyrrolidinium  
20 bromid and 5.90 g peppermint oil are then added and the resultant suspension is intensively homogenized. With further stirring and cooling the suspension is made up to 1032 g with cooled propellant 227 and then filled into metal cans which  
25 are closed with dosage valves that release 52  $\mu$ l of the suspension per stroke. Each stroke releases 350  $\mu$ g (3S,2'R)-

3-[cyclohexylhydroxyphenylacetyl)oxy]-1,1-dimethylpyrrolidinium bromide.

Example 24d: - Preparation of an aerosol formulation affording

5 a dose of 350  $\mu$ g (3S,2'S)-3-

[cyclohexylhydroxyphenylacetyl)oxy]-1,1-dimethylpyrrolidinium bromide per stroke (0.062 ml Suspension)

1000 g 2H-Heptafluoropropane (=HFA 227) are cooled to a  
10 temperature of about minus 55°C and reacted with stirring with  
a solution of 10.32 g polyoxyethylene-25-glyceryl trioleate  
(trade name: Tagat<sup>R</sup> TO, Goldschmidt AG) in 10.32 g absolute  
ethanol. 5.16 g micronized (3S,2'S)-3-  
[cyclohexylhydroxyphenylacetyl)oxy]-1,1-dimethylpyrrolidinium  
15 bromide and 5.90 g peppermint oil are then added and the  
resultant suspension is intensively homogenized. With further  
stirring and cooling the suspension is made up to 1032 g with  
cooled propellant 227 and then filled into metal cans which  
are closed with dosage valves that release 52  $\mu$ l of the  
20 suspension per stroke. Each stroke releases 350  $\mu$  (3S,2'S)-3-  
[cyclohexylhydroxyphenylacetyl)oxy]-1,1-dimethylpyrrolidinium  
bromide.

25 Example 25: - Preparation of an aerosol formulation affording  
a dose of 175  $\mu$ g (3R,2'R)-3-

[cyclopentylhydroxyphenylacetyl)oxy]-1,1-dimethylpyrrolidinium  
bromide per stroke (0.052 ml Suspension)

1000 g 2H-Heptefluoropropane (=HFA 227) are cooled to a  
5 temperature of about minus 55°C and reacted with stirring with  
a solution of 10.32 g polyoxyethylene-25-glyceryl trioleate  
(trade name: Tagat<sup>R</sup> TO, Goldschmidt AG) in 10.32 g absolute  
ethanol. 2.58 g micronized (3R,2'R)-3-

[cyclopentylhydroxyphenylacetyl)oxy]-1,1-dimethylpyrrolidinium  
10 bromid and 5.90 g peppermint oil are then added and the  
resultant suspension is intensively homogenized. With further  
stirring and cooling the suspension is made up to 1032 g with  
cooled propellant 227 and then filled into metal cans which  
are closed with dosage valves that release 52 µl of the  
15 suspension per stroke. Each stroke releases 175 µg (3R,2'R)-  
3-[cyclopentylhydroxyphenylacetyl)oxy]-1,1-  
dimethylpyrrolidinium bromide.

20 Example 26: - Preparation of an aerosol formulation affording  
a dose of 175 µg (3R,2'R)-3-[cyclohexylhydroxyphenylacetyl)oxy]-  
1,1-dimethylpyrrolidinium bromide per stroke (0.052 ml  
suspension),

25 1000 g 2H-Heptafluoropropane (=HFA 227) are cooled to a  
temperature of about minus 55°C and reacted with stirring with

a solution of 10.32 g polyoxyethylene-25-glyceryl trioleate (trade name: Tagat<sup>R</sup> TO, Goldschmidt AG) in 10.32 g absolute ethanol. 2.58 g micronized (3R,2'R)-3-

[cyclohexylhydroxyphenylacetyl)oxy]-1,1-dimethylpyrrolidinium

5 bromid and 5.90 g peppermint oil are then added and the resultant suspension is intensively homogenized. With further stirring and cooling the suspension is made up to 1032 g with cooled propellant 227 and then filled into metal cans which are closed with dosage valves that release 52  $\mu$ l of the  
10 suspension per stroke. Each stroke releases 175  $\mu$ g (3R,2'R)-3-[cyclohexylhydroxyphenylacetyl)oxy]-1,1-dimethylpyrrolidinium bromide.
